
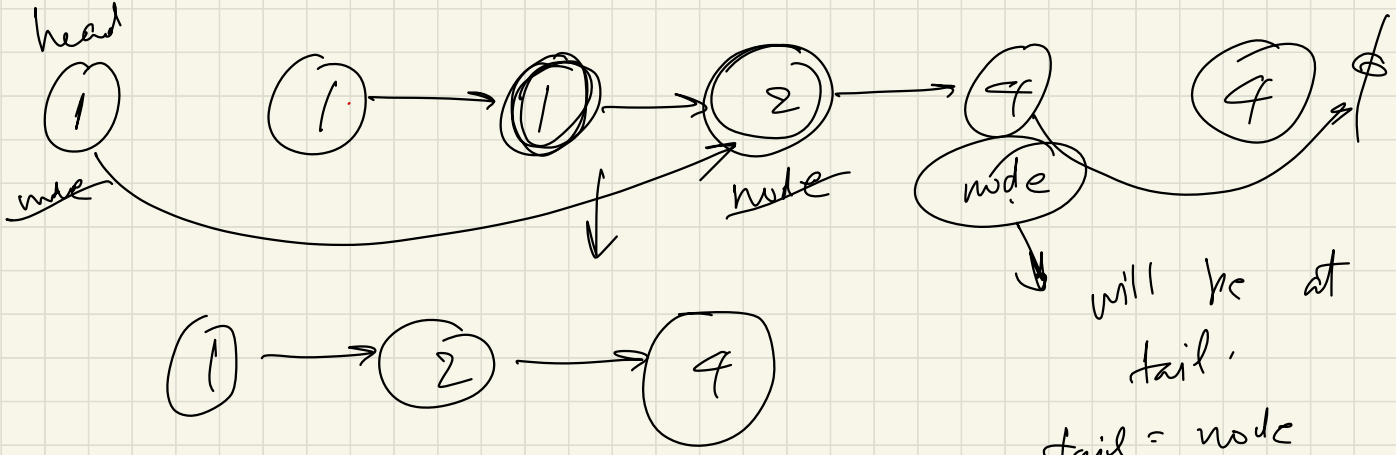
① void return type & make changes in ll

② node return type that returns the list node to change the structure.

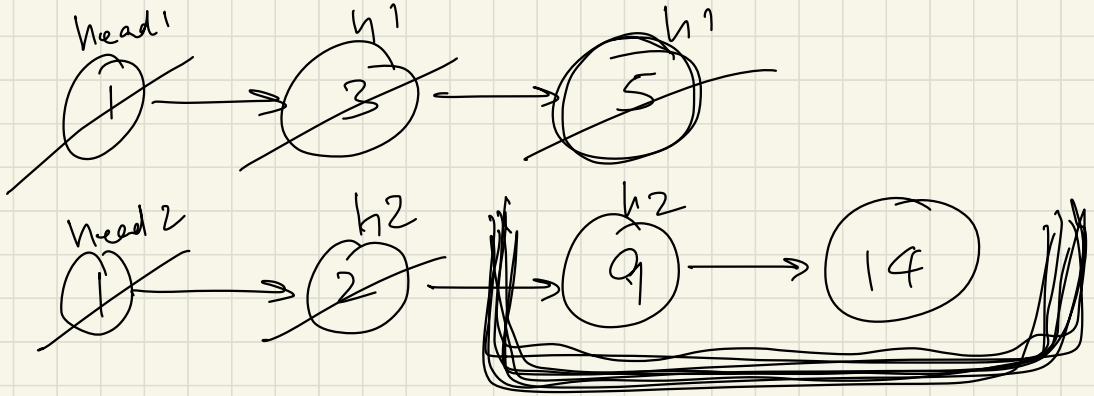
Q:



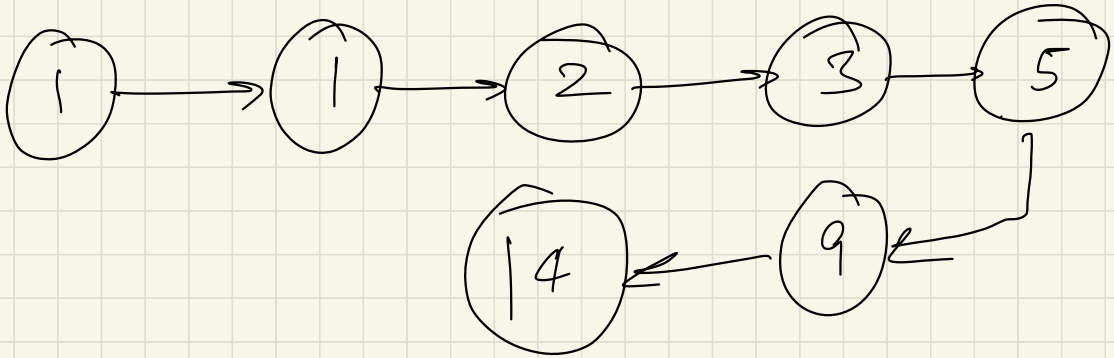
Q

list 1 :

list 2 :



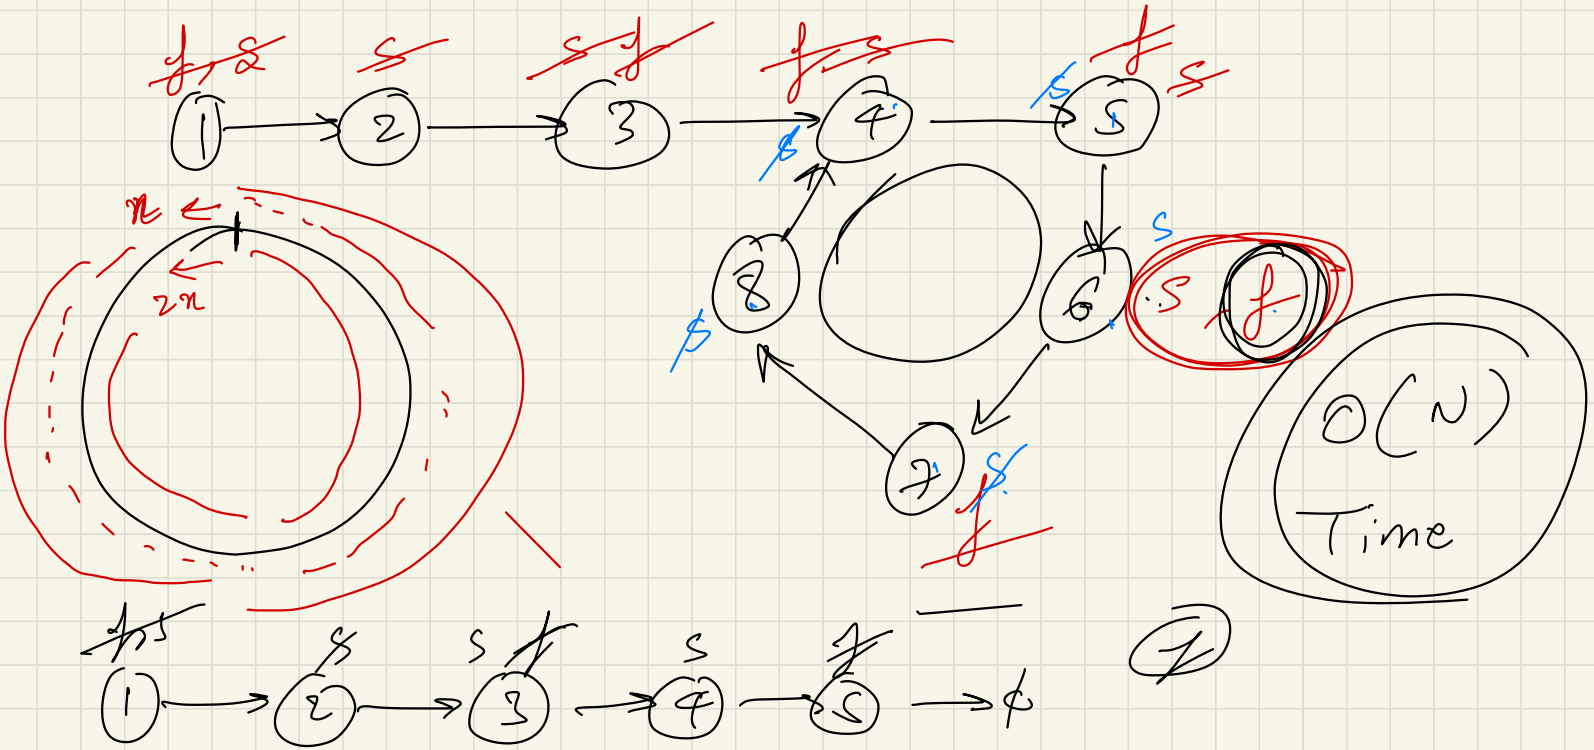
ans :



---

fast & slow pointer:

- Cycle detection
- Finding a node in cycle, etc.



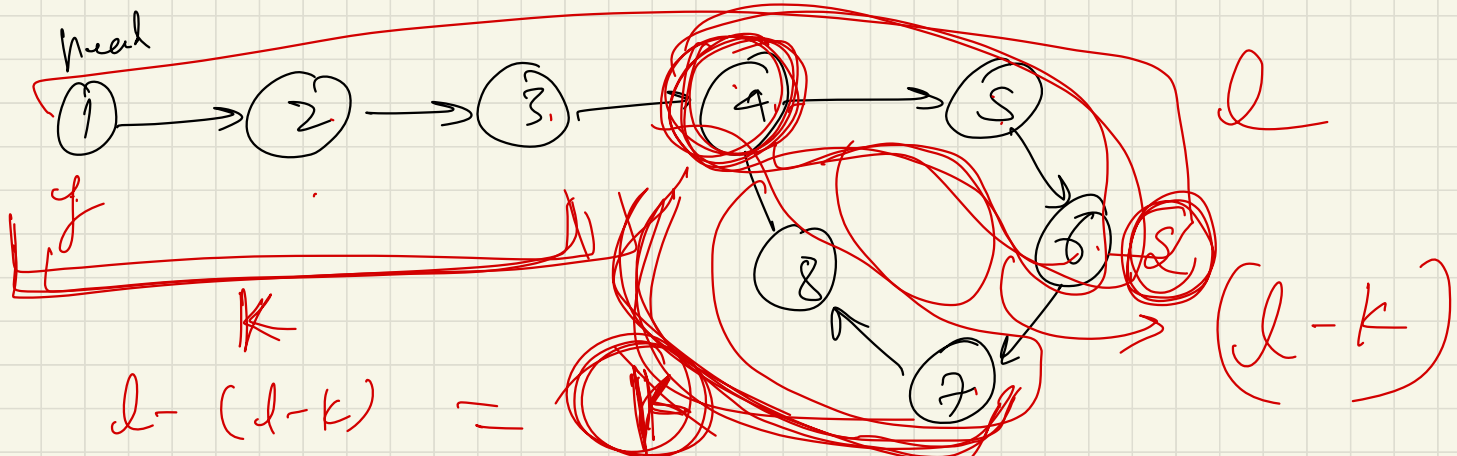
n
2n
O(N)
Time

2 possibilities:

① f 2 → f — s y

② 2 $f - 2$ → $f, 2$ → in 2 steps both they will meet

Q



① Find length of cycle ✓

② move S ahead by length of cycle times.

③ move S & f one by one, it will meet at start.

Q: Google Question

Ex: 12 ⇒ $1^2 + 2^2 = 1 + 4 = 5$

$5^2 = 25$

$2^2 + 5^2 = 4 + 25 = 29$

$2^2 + 5^2 = 4 + 81 = 89$

$8^2 + 9^2 = 64 + 81 = 145$

$1^2 + 4^2 + 5^2 = 42$

$4^2 + 1^2 = 20$

$2^2 + 0 = 4$

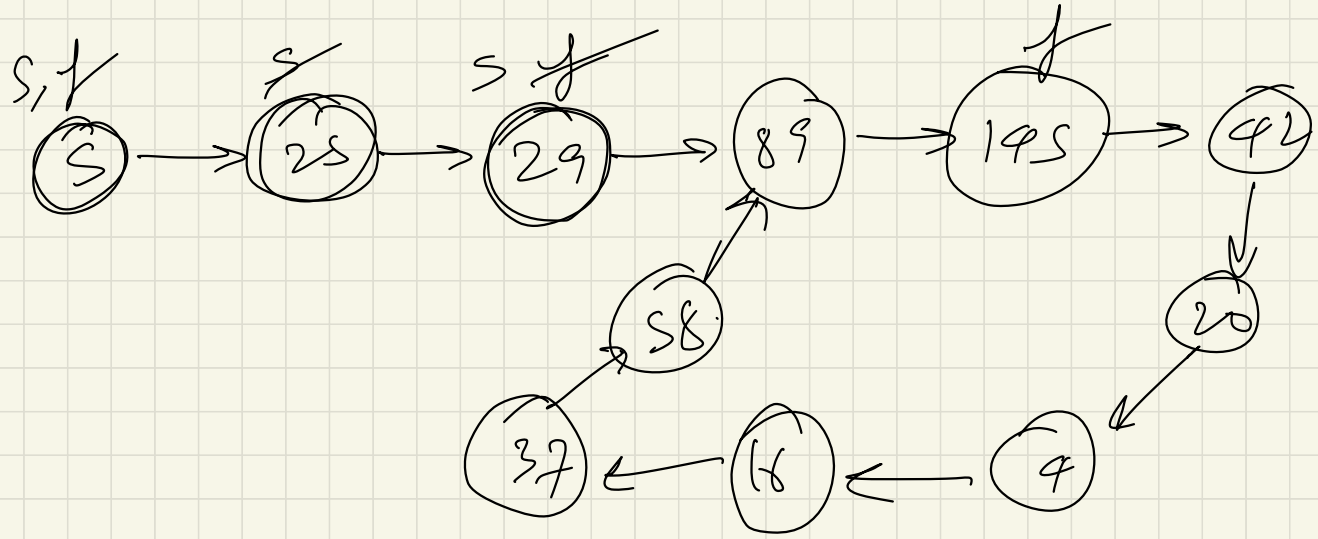
$4^2 = 16$

$1^2+6^2 = 37$

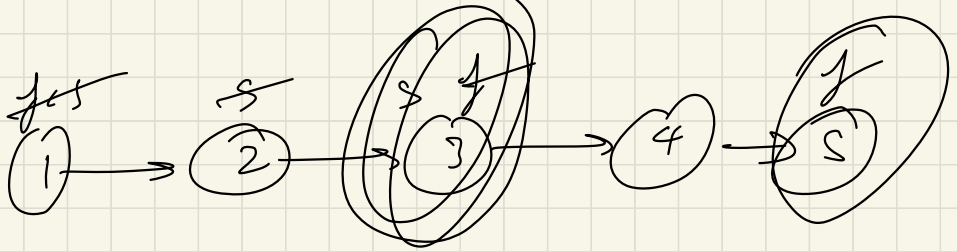
$3^2+7^2 = 9+49 = 58$

$5^2+8^2 = 25+64 = 89$

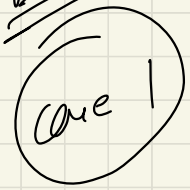
$8^2+9^2 = \ldots$

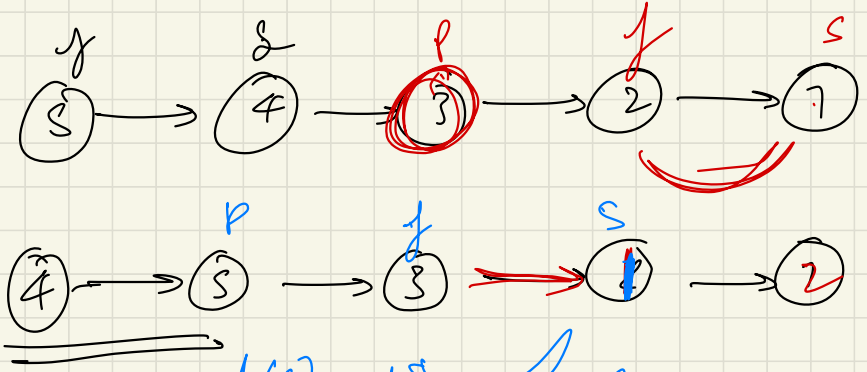


Q: middle



BS

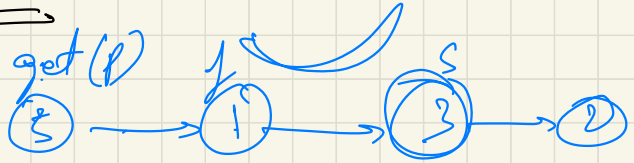




head = s

f.next = s.next

s.next = f



p.next = s

f.next = s.next

s.next = f

case 2

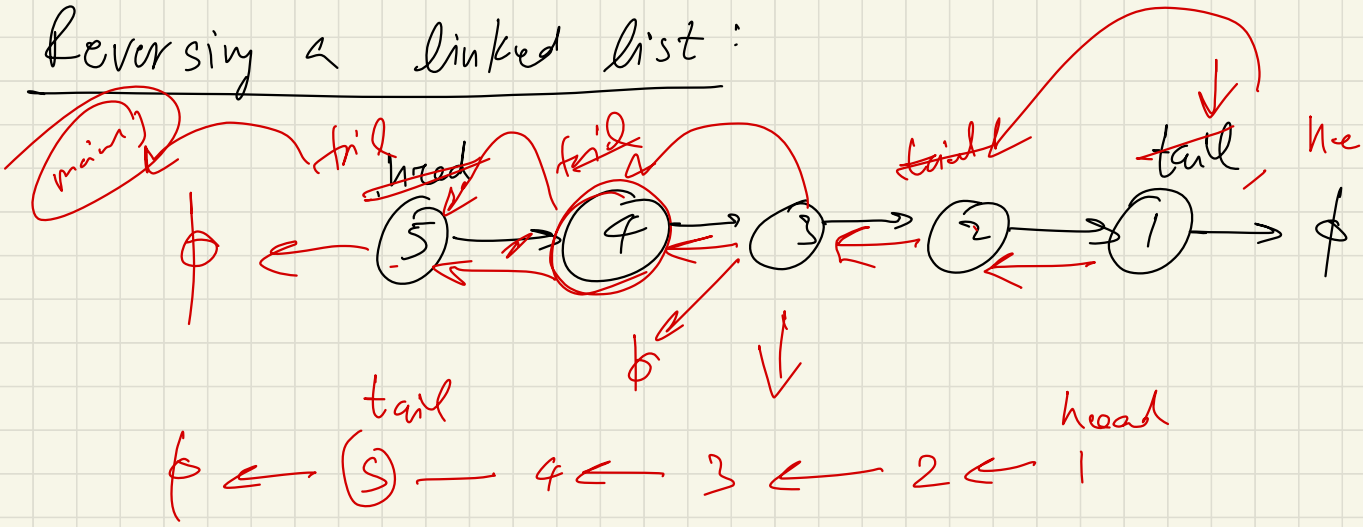
p.next = s

tail = f

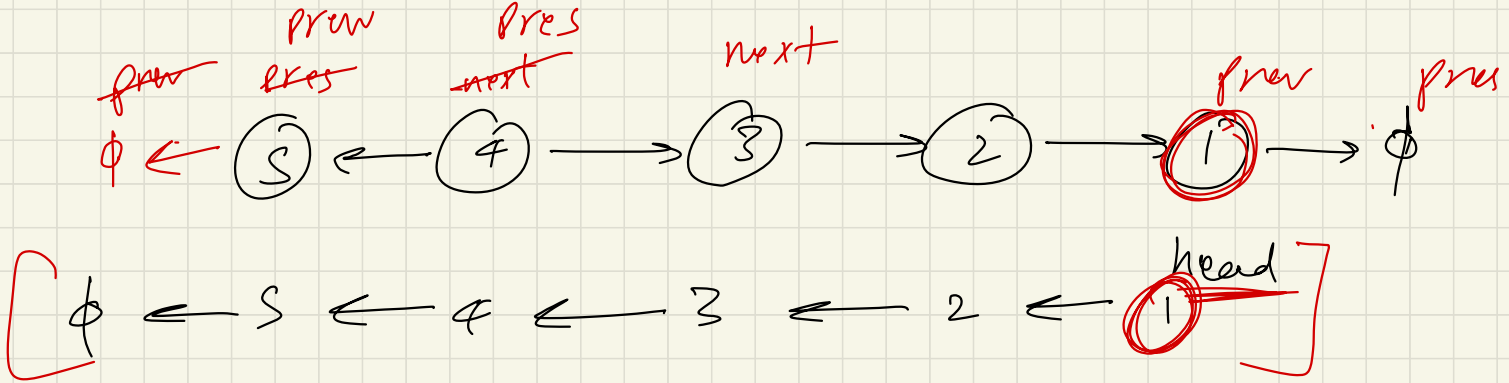
f.next = ϕ

s.next = tail

Reversing a linked list:



```
tail.next = node
tail = node
tail.next = ϕ
```



while (prev.next != null):

prev.next = prev

prev = pres

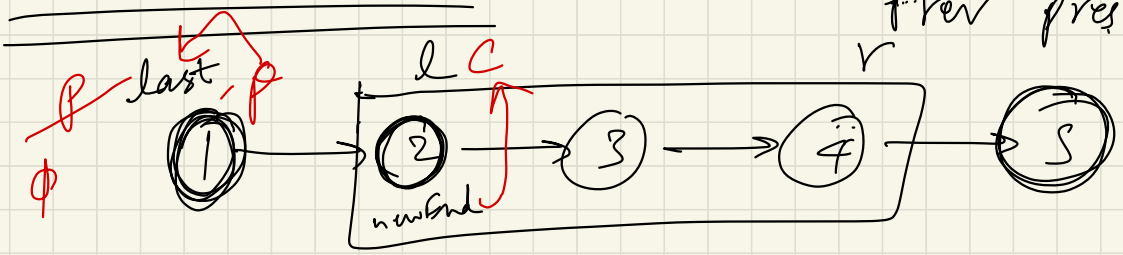
pres = next

next = next.next // note: ∅ pointer check

In the end:

head = prev.

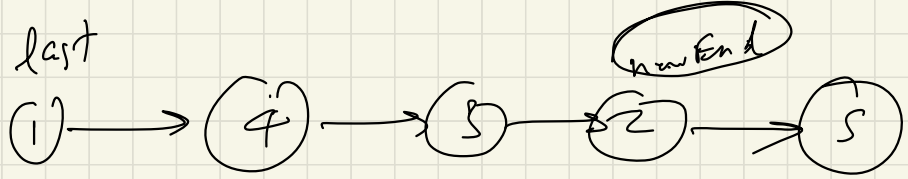
Q Reverse a LL - II



l = 2

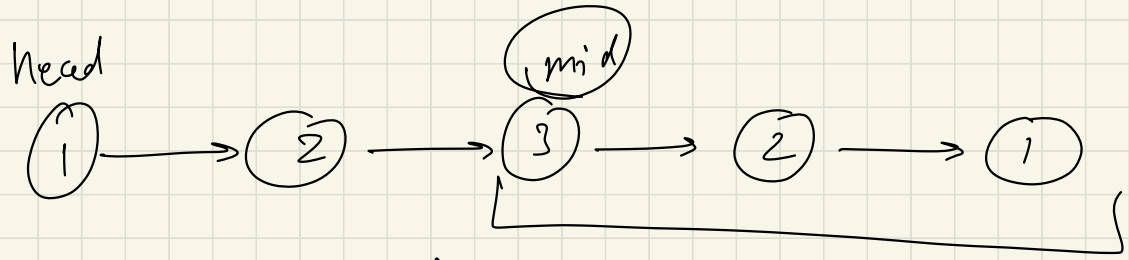
r = 4

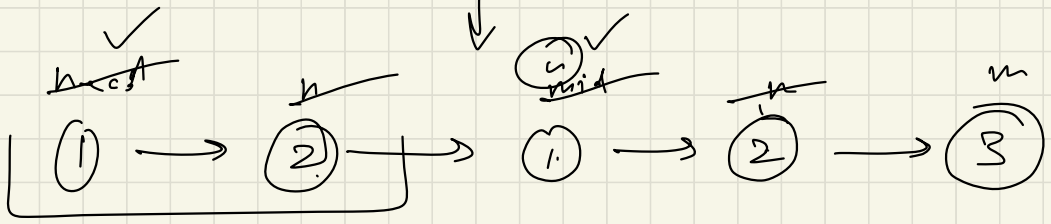
prev pres next

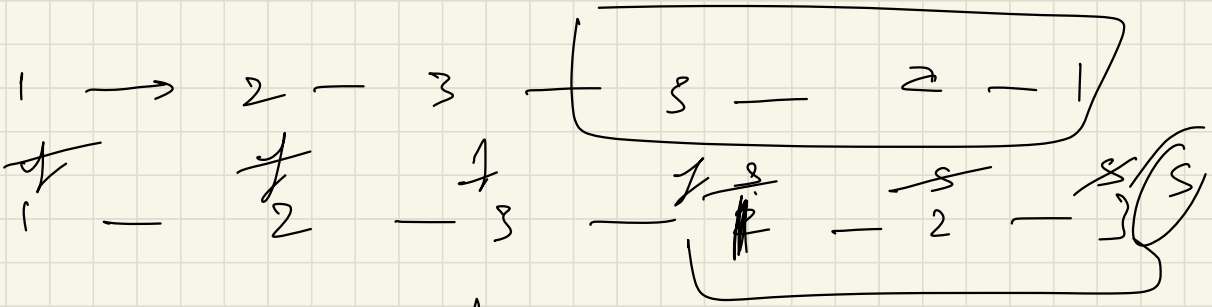


last.next = p / if last = ϕ :
head = p

Q:

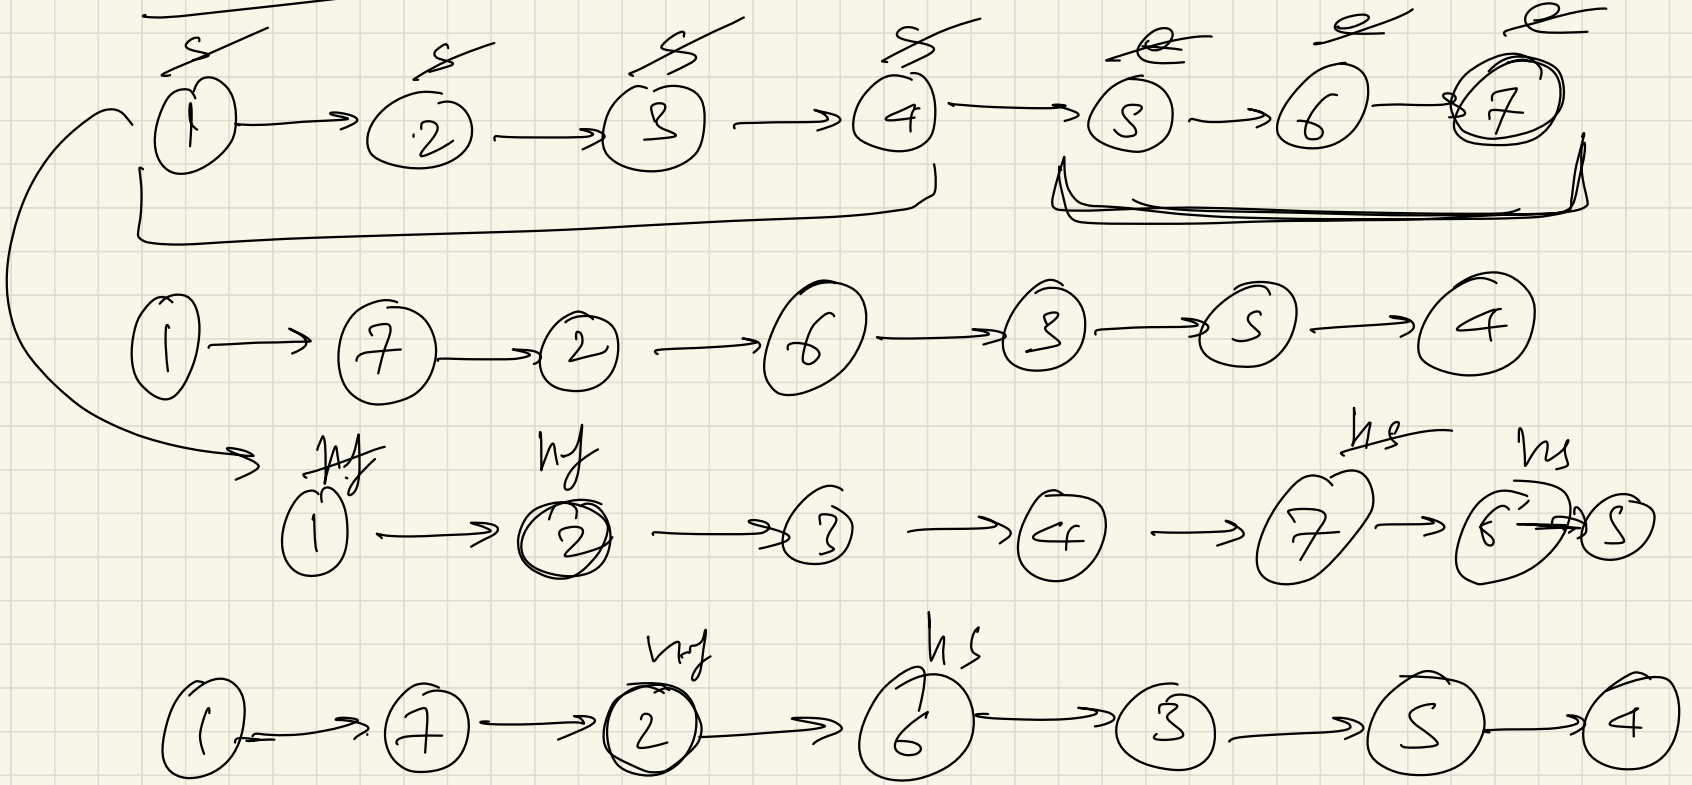






re-reverse the second half.

Q: Pre-order list:



✓ temp = nf.next

nf.next = ns

nf = temp

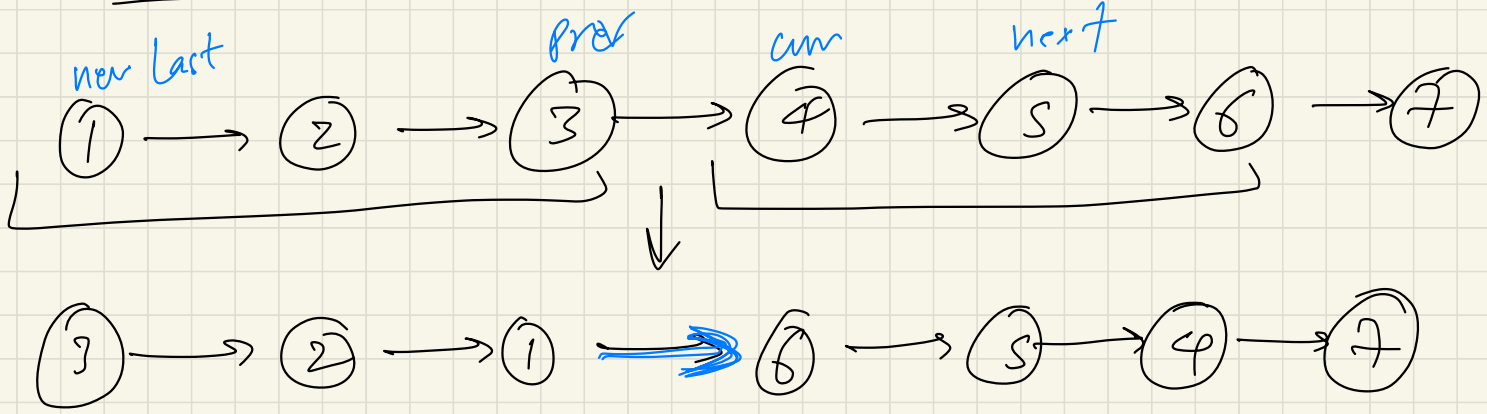
✓ temp = ns.next

ns.next = nf

ns = temp

Q: Rev every k- node :

k = 3

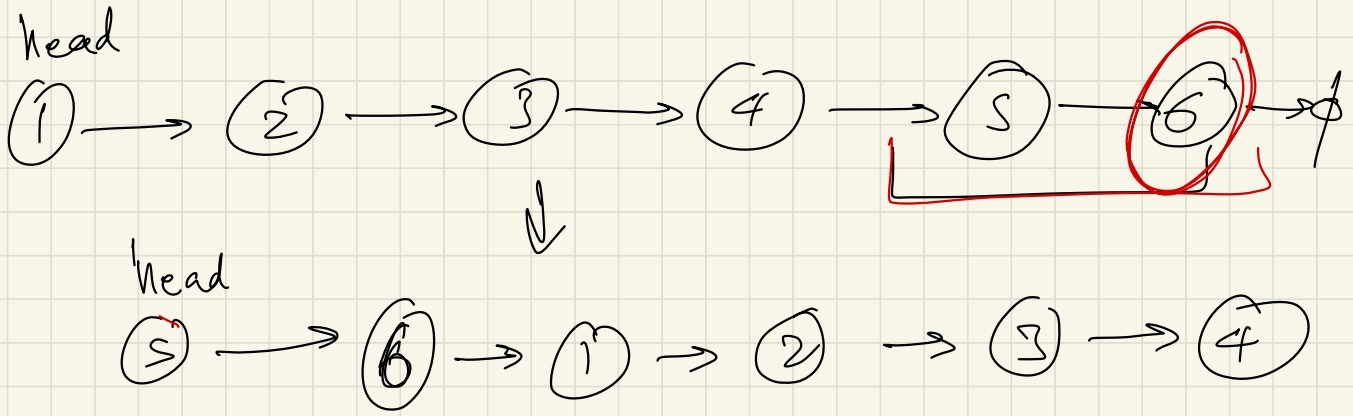


run a for loop k times till cur != ϕ

new last . next = current

Q:

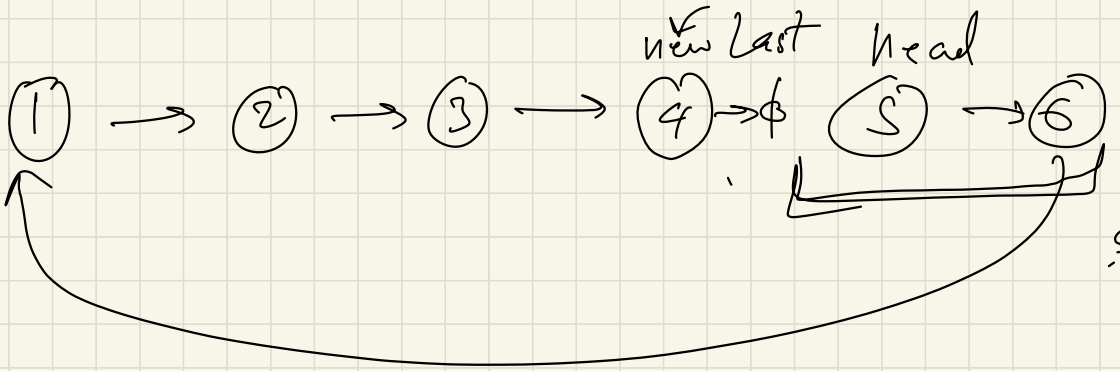
k = 3



① original last node . next → original head

② new head = start of sub list

③ new tail = node before



$k = 2$

$skip = l - k$

$l = 6$

head = newLast.next

newLast.next = ϕ

rotations = $k \% l$
